1 Background

ZSim: An x86-64 multicore <u>simulator</u>, with fully <u>directory-based cache</u> system following a tree structure (LLC is root node at top, L1d and L1i are leaf nodes at bottom)

<u>Migratory Sharing:</u> Multiple processors take turns to <u>read and modify shared resources one</u> <u>at a time</u>, e.g. accessing shared data structures inside a critical section

<u>Issue:</u> If migratory sharing can be detected, the access pattern can be optimized!

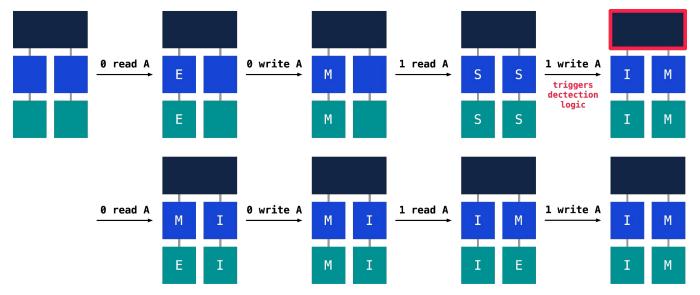

2 Algorithm

Trigger detection when <u>read-exclusive request</u> on a non-migratory line

If the line has <u>two sharers</u> at this moment, and the <u>last read-exclusive requester</u> is NOT the current one \rightarrow mark the line migratory

Migratory mark gone when the line is evicted or number of sharers > 2 at any time

Read request on migratory object is treated as Read-Exclusive

<u>Edge Cases:</u> what if some processor changes behavior to only <u>read</u> the migratory object after the object is marked migratory? (Alteration of Access Pattern)

3 Experiment Setup

<u>Micro-benchmark:</u> Improvement more visible as tests have the access patterns we define; runnable in our VMs with limited computing capabilities

Machine: Ubuntu 16.04 VM with 2 vCPUs on a x86-64 PC

Interested Stats:

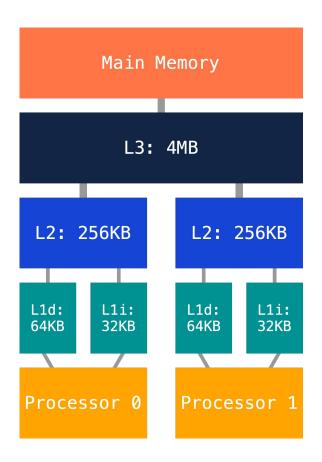

Instructions Simulated
Cycles Simulated
L1d/L2 Upgrade Miss Count
L1d/L2 True Invalidation (INV) Count
L1d/L2 Downgrade Invalidation (INVX) Count

* Each stats has a $\underline{\text{Core ID}}$ (0 or 1) and $\underline{\text{ZSim version}}$ used (default or optimized)

* Upgrade Miss: Read-Exclusive on S State

* True Invalidation: Non-I State Change to I State

* Downgrade Invalidation: M/E State Change to S State

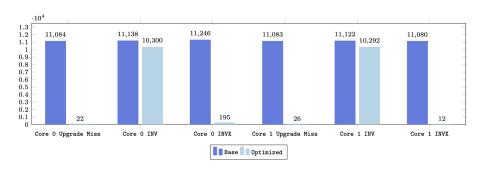

4 Results: Test 0 & Test 1

Test 0:

- → Verify improvement on migratory sharing pattern
- → Migratory object is an <u>integer array</u>

Table 1: Instruction and Cycle Count of Test 0

Implementation	Core 0 ins	Core 0 cycle	Core 0 IPC	Core 1 ins	Core 1 cycle	Core 1 IPC	Average IPC improvement (%)
Base Optimized	40959334 40960190	$\begin{array}{c} 51574552 \\ 51497937 \end{array}$	$\begin{array}{c} 0.7972943342 \\ 0.7985053393 \end{array}$	$\frac{40775651}{40776932}$	$\frac{51142532}{51066574}$	$\begin{array}{c} 0.7972943342 \\ 0.7985053393 \end{array}$	0.1513786423

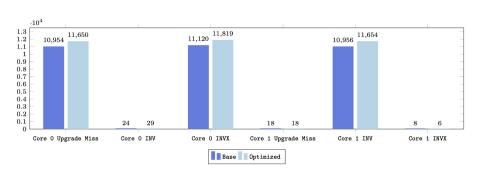

Test 1:

- → Verify non-migratory object not detected as migratory object
- → A naïve <u>producer-consumer pattern</u> (graph above)

Table 2: Instruction and Cycle Count of Test 1

Implementation	Core 0 ins	Core 0 cycle	Core 0 IPC	Core 1 ins	Core 1 cycle	Core 1 IPC	Average IPC improvement (%)
Base Optimized	$\frac{40848255}{40848255}$	$\begin{array}{c} 51297351 \\ 51297164 \end{array}$	0.7963033998 0.7963063026	$\frac{40478789}{40478789}$	$\begin{array}{c} 50444215 \\ 50445551 \end{array}$	$\begin{array}{c} 0.8024466036 \\ 0.8024253516 \end{array}$	-0.001147717365

Results: Test 2 & Test 3

Test 2 & Test 3:

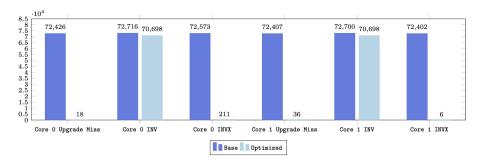

- → Extensions of test 0 with <u>different migratory objects</u> and <u>increased workload</u>
- → Verify improvement on migratory sharing pattern
- \rightarrow Migratory object is a <u>linked list</u> for test 2, a <u>struct array</u> for test 3

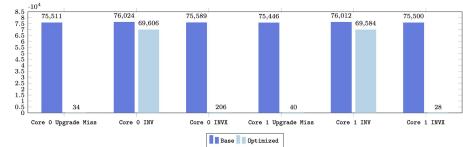

Table 3: Instruction and Cycle Count of Test 2

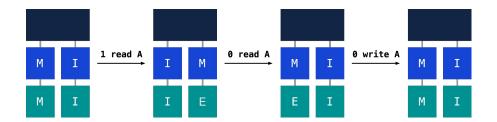

Implementation	Core 0 ins	Core 0 cycle	Core 0 IPC	Core 1 ins	Core 1 cycle	Core 1 IPC	Average IPC improvement (%)
Base Optimized	$\frac{101414640}{101414944}$	$\frac{128525342}{128328283}$	0.789063374 0.7902774169	$\frac{101227078}{101227243}$	$\begin{array}{c} 128102355 \\ 127904454 \end{array}$	$\begin{array}{c} 0.790204661 \\ 0.7914286003 \end{array}$	0.1543741893

Table 4: Instruction and Cycle Count of Test 3

Implementation	Core 0 ins	Core 0 cycle	Core 0 IPC	Core 1 ins	Core 1 cycle	Core 1 IPC	Average IPC improvement (%)
Base Optimized	$\frac{105487777}{105492247}$	$\frac{131609804}{131444466}$	$\begin{array}{c} 0.8015191406 \\ 0.8025613418 \end{array}$	$\begin{array}{c} 105303021 \\ 105310317 \end{array}$	$\frac{131192108}{131030143}$	$\begin{array}{c} 0.8026627715 \\ 0.8037106164 \end{array}$	0.1302873499

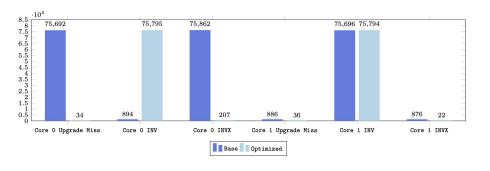

6 Results: Test 4 & Test 5

Test 4:

- → Migratory sharing changes to naïve producer-consumer pattern
- → Still treated as migratory, <u>no degradation</u> (graph above)

Table 5: Instruction and Cycle Count of Test 4

Implementation	Core 0	Core 0	Core 0	Core 1	Core 1	Core 1	Average IPC
	ins	cycle	IPC	ins	cycle	IPC	improvement (%)
Base Optimized	$\begin{array}{c} 105473191 \\ 105473152 \end{array}$	$\frac{131292665}{131290458}$	$\begin{array}{c} 0.8033441244 \\ 0.8033573316 \end{array}$	$\frac{104077090}{104077044}$	$\frac{128027300}{128023524}$	$\begin{array}{c} 0.8129288831 \\ 0.8129525008 \end{array}$	0.002278383362

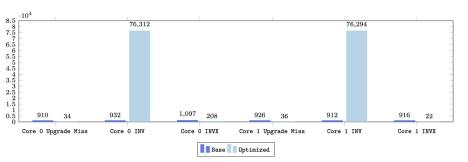

Test 5:

- → Migratory sharing changes to <u>read-only</u> <u>pattern</u>
- → Still treated as migratory, processors invalidate each other, <u>degradation</u> observed

Table 6: Instruction and Cycle Count of Test 5

Implementation	Core 0 ins	Core 0 cycle	Core 0 IPC	Core 1 ins	Core 1 cycle	Core 1 IPC	Average IPC improvement (%)
Base Optimized	$\frac{104260413}{104260600}$	$\frac{127778163}{128481455}$	$\begin{array}{c} 0.8159485984 \\ 0.8114836495 \end{array}$	$\frac{104077044}{104077217}$	$\frac{127345461}{128029753}$	$\begin{array}{c} 0.8172811436 \\ 0.8129142997 \end{array}$	-0.5407563013

7 Fix Edge Cases

After migratory detection on A, a read from core 0 is treated as read-exclusive, granting 0 the exclusive copy of A

<u>Define:</u>

<u>Event X</u>: 0 modifies A, causing silent state transition at L1d <u>Event Y</u>: 1 read A, request sent to and handled by L3

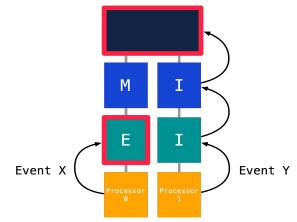

Issue:

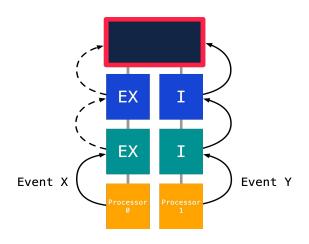

<u>Event X</u> and \underline{Y} detected by separate components in ZSim, there is no communication to exchange those detection information

Solution:

- → Introduce new state EX, given to initial read request on migratory object
- \rightarrow If <u>Event X</u> happens first, EX -> M, send special message to L3, migratory object stays migratory
- \rightarrow If <u>Event Y</u> happens first, L3 sends downgrade invalidation, EX -> S, migratory object is no longer migratory

Now, L3 can detect both $\underline{Event X}$ and \underline{Y}

8 Conclusion and Reflection

Migratory Sharing Optimization <u>Tradeoffs</u>

Benefits:

Small improvement only when accessing migratory objects

Extra States	Costs in ZSim
migratory flag	a boolean
last read-exclusive requester index	a 32-bit index number

Costs:

If implemented in hardware, several additional bits required for each cache line

Migratory Sharing Optimization <u>may not be worth it</u> in real cache architecture design!

Potential Improvements:

- → Implement the alteration check to fix edge cases
- → Run standard benchmarks like SPEC on a powerful testing machine
- → Configure test environments to simulate existing architectures
- → Add traffic contention simulation to ZSim, making improvement metrics more accurate
